Abstract

The damages caused by *Mycosphaerella graminicola* on wheat cultures are shown in the case of disease intensity depends on the time of onset of infection and the weather. Results from few years investigations up to 2015-2016, where are included continuously checking of fields symptoms and laboratory analysis of *Mycosphaerella graminicola* on wheat.

Generally speaking, some areas with strong and more frequent rainfall enable increased levels of disease. The samples are compared with previous obtained and published data using light microscope by micrometric characteristics using light microscope view of morphological characteristics.
